Camp Resource 2015, Asheville, August 3

# Assurance Contract in the Private Provision of Ecosystem Services: Evidence From A Pilot Field Experiment

Pengfei Liu<sup>1</sup>, Stephen K. Swallow<sup>1,2</sup>

<sup>1</sup>Department of Agricultural and Resource Economics, University of Connecticut <sup>2</sup>Center for Environmental Sciences and Engineering, University of Connecticut

Funded by:

United States
Department of
Agriculture

National Institute of Food and Agriculture

and Agricultural Experiment Stations at the University of Connecticut

Supply

Demand

Landowners, farmers, wetland managers that provide ecosystem services.

Water quality, carbon sequestration, habit protection.

Individuals who benefit/value the ecosystem services.

Government, Conservation Programs.

Supply

**Demand** 

Landowners, farmers, Water quality, carbon sequestration, habit protection wetland managers that Individuals who provide ecosystem benefit/value the services.

Monetary Compensation ecosystem services.

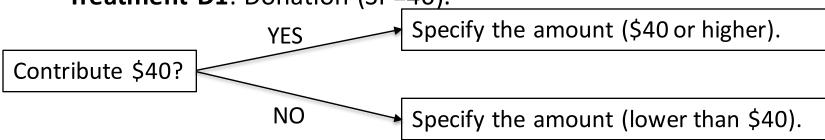

- Most researches on ecosystem markets focus on the supply side: how to induce ecosystem service providers to provide more, or induce nonproviders to provide ecosystem services.
- We focus on the demand side of the problem: How to induce ecosystem service beneficiaries to pay for such services.

We conduct a field experiment that directly connects the ES provider and beneficiaries.

- Supply: Bird Habitat through delaying harvest.
- Demand: Local residents who care about the bird habitat.
- Location and Time: Jamestown and Aquidneck Island, RI in 2014.
- Mechanism: Provision point mechanism with money back guarantee.
- Compare the total contribution from local residents <u>with</u> the cost of delaying hay harvest (providing the bird nesting habitat) for one field.

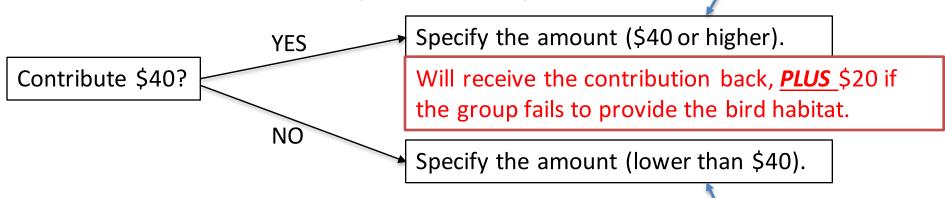

#### **Treatment**

Treatment D1: Donation (SP=40).

- Treatment D2: Donation (SP=60).
- Treatment A1: Assurance (SP=40, AP=20).

Eligible for the assurance contract.

- Treatment A2: Assurance (SP=40, AP=40).
- Treatment A3: Assurance (SP=60, AP=40).

Not eligible for the assurance contract.

#### Theoretical Remarks:

 A positive assurance payment reduces, but do not completely eliminate the non-provision equilibrium strategies

#### Intuitions:

- Assurance contract encourages commitments to pay by offering compensation to individuals who commit to making a donation, and paying that compensation when the group fails to provide the public good (and no donations are collected).
- It removes the fear that your efforts will be wasted (assurance against transaction cost).
- If enough people contribute to the bird habitat will be provided and we won't have to pay the assurance payment!
- This basic idea is from Tabarrok (1998). We extend and combine it with provision mechanism.

### **Implementation**

- Post mails and Internet (<a href="http://www.bobolinkproject.com">http://www.bobolinkproject.com</a>).
- Randomly assign subjects to treatment.

Results: Donation Amount, Regression Results using OLS and Interval Regression

Presence of Assurance Contract does not increase donation.

A higher suggested price increases donation.

A higher suggested price combined with assurance contract decreases donation.

## Results: Donation Probability, web donation only

	Pledged	Rejected	Pledge Probability	Total
No Assurance	6	9	40%	15
Assurance	18	7	72%	25
Total	24	16	60%	40

Assurance contract induces a higher donation probability. The difference in pledge probability is significant based on a Chi-square test.

## Log file from the web donation (Part of the data).

#### **Outcomes:**

- The cost for the bird habitat is \$4,500 (pre-contract with a farmer), we raised \$4,377 from 67 individuals.
- We returned all the contributions, plus \$1240 assurance payment for those eligible.

#### Limitations and future directions:

- Sample size. Lab experiment to test the field experiment results.
- Dynamic setting. Build trust and reputation.
- Selection bias. Assurance contract attracts risk-loving individuals?
