

# Abate or Abscond?

## The Response of Polluting Plants to Environmental Regulation

J. Scott Holladay <sup>1</sup>

Camp Resources

# The Impact of Environmental Regulation

An illustrative example:

**Table:** Comparing Plants Avg in Regulated and Unregulated Counties

	Sales	Emp	Emissions (lbs)	Hazard
Unregulated	\$22,861,348	127	431,416	116
Regulated	\$8,259,664	51	223,447	146

Polluting plants: SIC 2851 (Paint and Varnish) in Ohio

- ▶ Emissions are non-targeted pollutants
- ▶ Regulated polluters are smaller and pollute less
- ▶ Regulated polluters emit more toxic pollutants

# Preview of Results

- ▶ Pollution regulation is effective against non-targeted pollutants
- ▶ There is little impact on plant location decisions
- ▶ The least productive plants close in response to regulation
- ▶ Remaining plants reduce output and cut employment

# Literature Review

- ▶ Voluminous literature on the impact of environmental regulations
- ▶ Jaffe *et al*; Earnhart and Shadbegian/Gray examine the impact of regulation on pollution
- ▶ More recent work by Greenstone; List
- ▶ Morgenstern, Pizer and Shih carefully calculate employment effects, estimate output effects

- ▶ Monitor Data
  - ▶ Summary statistics from annual ambient concentrations
- ▶ Attainment Status
  - ▶ Taken from the Green Book
- ▶ County Characteristics
  - ▶ Population, education, income, race at the county level among many others
  - ▶ Irregular intervals interpolated to create panel
  - ▶ All results robust to interpolation technique from Fernandez and Montuenga-Gomez (2003)

# Establishment Level Data

## Plant level characteristics from the National Establishment Time Series

- ▶ Sales, employees, credit rating, location details, 8-digit SIC industry
- ▶ Export status
- ▶ Detailed information on firm structure

## Plant level pollution from the EPA's RSEI and TRI data sets.

- ▶ Pounds of emissions of all toxic chemicals
- ▶ Hazard Score: quantity of emissions weighted by the toxicity of each chemical
- ▶ Risk Score: Hazard score weighted by the exposed population

The data cover 12,000 plants over 12 years in 2550 counties and 441 SIC4 digit industries

# Importance of Chemical Heterogeneity

Chemical	Hazard Score	Use
Propylene	0.6	Plastics
Hydrochloric Acid	90	Industrial Applications
Sodium Fluoroacetate	25,000	Pesticide

- ▶ Approximately 580 chemicals on the list
- ▶ Huge variance in toxicity
- ▶ Using pounds weights chemicals equally, poor proxy for damage

# Importance of Chemical Heterogeneity (cont.)

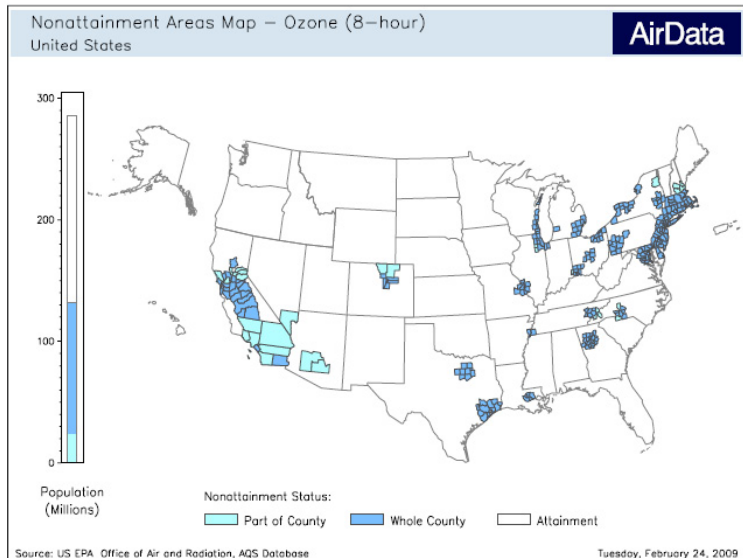

Tradename	Monsey-Bakor	Hunt Wesson Foods
City	Rock Hill	Memphis
Year	SC	TN
Sales	\$4,912,500	\$79,175,000
Emp	30	250
Pounds	<b>345</b>	<b>2,558,781</b>
Hazard	<b>345,000,000</b>	<b>195,640</b>
Main Emission	Asbestos	Amonia
SIC	2952	2076
Industry	Asphalt Felts and Coatings	Vegetable Oil Mills

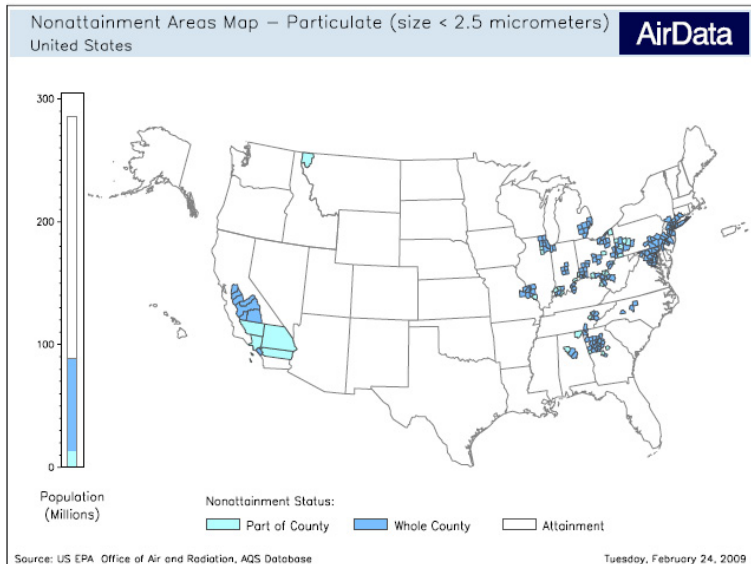

# EPA Non-Attainment Status

- ▶ EPA designates high pollution counties as non-attainment if ambient levels are above standard
- ▶ 6 criteria air pollutants are regulated
  - ▶ CO, PM-10, SO<sub>2</sub>, NO<sub>2</sub>, Lead, Ozone
- ▶ Non-Attainment counties face strict environmental regulations
  - ▶ New sources subject to review, must use best available abatement technology
  - ▶ Existing sources required to upgrade to to best practical abatement technology
  - ▶ Counties that remain above standards face reduced federal funding

# Non-Attainment Counties for Ground Level Ozone

# Non-Attainment Counties for PM 2.5

- ▶ Compare plant openings, closings, characteristics and emissions between attainment and non-attainment counties
- ▶ Conduct a series of difference-in-difference regressions with attainment status being the variable of interest
  - ▶ An indicator variable if a county is ever in non-attainment status
  - ▶ An indicator variable if a county is currently in non-attainment status
  - ▶ The interaction of those two indicators is the diff-in-diff estimator
- ▶ Truncated regressions include plant/county characteristics, industry and year fixed effects

# Plant Location Impacts of Regulation (Extensive Margin)

- ▶ Least productive plants exit immediately after the designation
  - ▶ Exiting plants are around 14% less productive than survivors in same industry
- ▶ After three years exit returns to the pre-regulation level
- ▶ Entry remains constant despite regulation
  - ▶ Plant location is planned far in advance
  - ▶ Regulated counties are more attractive places to locate

# Exiting Plants' Characteristics

Table: Exiting Plants in Non-Attainment Counties

	Survive	Exit
Sales	\$27,874,980	\$21,451,210
Emp	265.8	215.7
Productivity	1,119.0	1,057.9
Export	36.2 %	19.3 %

- ▶ Exiting plants are smaller in terms of sales and employees
- ▶ Surviving plants are somewhat more productive
- ▶ Exporters are much less likely to be forced to exit
- ▶ In attainment counties there are no significant differences

# The impact of attainment status on output

Dep Var	Log Sales	Log Sales	Log Sales	Log Sales
Status	-0.0588*** (-6.37)	-0.0574*** (-6.20)	-0.0978*** (-10.09)	-0.0832*** (-8.91)
Relocations				-0.273*** (-28.87)
Exporter				0.273*** (34.75)
Public				0.602*** (70.30)
New				-0.476*** (-34.30)
$r^2$		0.000372	0.00977	0.0811
N	104,732	104,732	104,732	104,732
Fixed Effects		SIC6	SIC6, Year	SIC6, Year

► Plants are responding at the intensive margin 

# The impact of attainment status on employment

Dep Var	Emp	Emp	Emp	Emp
Status	-6.360 (-1.27)	-6.229 (-1.24)	-7.712 (-1.46)	-3.166 (-0.60)
Relocation				-4.012 (-0.76)
Export				23.27*** (5.29)
Public				187.1*** (38.96)
New				-93.09*** (-11.97)
r <sup>2</sup>	0.00000	0.0000149	0.000139	0.0163
N	104732	104732	104732	104732
Fixed Effects		SIC6	SIC6, Year	SIC6, Year

- ▶ Plants are not dropping employment

# The Output and Employment Impacts of Regulation

- ▶ Remaining plants reduce output in response to regulation
  - ▶ After controlling for plant characteristics output drops 10%
- ▶ Employment drops for two reasons:
  - ▶ The least productive firms exit
  - ▶ More productive plants cut output
  - ▶ Total reduction is around 6 people per plant (not sig)
- ▶ Exporters see a slightly smaller decrease in output
- ▶ The highest 10% of the productivity distribution actually see an increase
- ▶ Suggests industry specific skill ( $\theta$ ) is relatively high

# Matching Procedure

- ▶ Use matching estimators to select similar counties
- ▶ Match counties entering non-attainment with counties that are never regulated
- ▶ Matching variables:
  - County characteristics: Population, density, education, income,
  - Pollution characteristics: Summary stats of emissions, 3 year weighted averages

# Plant Location Decisions

Table: The number of plant openings by county type

Year	Openings Attainment	Openings Matched Non-Attainment
t-2	74.4%	25.6%
t-1	72.3%	27.7%
t	73.6%	26.4%
t+1	74.7%	25.3%
t+2	74.8%	25.2%
t+3	72.6%	27.4%
t+4	78.8%	21.2%
t+5	75.1%	24.9%

- ▶ Match counties on observable characteristics
- ▶ Openings are constant are fairly constant after designation

# Conclusions and Future Research

- ▶ Environmental regulations work and delivery ancillary benefits
- ▶ Plants respond primarily along the intensive margin
- ▶ Regulation leads to small job loss in regulated industries
- ▶ Weak/no evidence of the pollution haven effect which has implications for the race to the bottom
- ▶ Possible causality issues for the Porter Hypothesis
- ▶ Extensions:
  - ▶ Expand Use of Matching estimators
  - ▶ Regression discontinuity
